zensulfonyl)indoles compounds of the general formula (I) in which Ar, R²,

laxis of disorders relating to the said receptor, such as obesity and CNS
disorders.

2-, 3-, 4-, or 5-substituted-N1-(benzensulfonyl)indoles and their use in therapy

TECHNICAL FIELD

The present invention relates to novel 2- 3-, 4- or 5-substituted-N1-(benzensulfonyl)indole compounds, to pharmaceutical compositions comprising the compounds and to the use of the compounds for the preparation of a medicament for the treatment of obesity and CNS disorders as well as method of treatment of these disorders.

BACKGROUND ART

Obesity is a condition characterized in an increase in body fat content resulting in excess body weight above accepted norms. Obesity is the most important nutritional disorder in the western world and represents a major health problem in all industrialized countries. This disorder leads to increased mortality due to increased incidences of diseases such as cardiovascular disease, digestive disease, respiratory disease, cancer and NIDDM (type II diabetes). Searching for compounds, which reduce body weight has been going on for many decades. One line of research has been activation of serotonergic systems, either by direct activation of serotonin receptor subtypes or by inhibiting serotonin reuptake. The exact receptor subtype profile required is however not known.

Serotonin (5-hydroxytryptamine or 5-HT), a key transmitter of the peripheral and central nervous system, modulate a wide range of physiological and pathological functions, including anxiety, sleep regulation, aggression, feeding and depression. Multiple serotonin receptor subtypes have been identified and cloned. One of these, the 5-HT₆ receptor, was cloned by several groups in 1993 (M Ruat, E Traiffort, J-M Arrang, J Tardivel-Lacombe, J Diaz, R Leurs, J-C Schwartz. *Biochem. Biophys. Res. Commun.* 1993, 193 (1) 268-276; M Sebben, H Ansanay, J Bockaert, A Dumuis, *NeuroReport* 5, 2553-2557 (1994).) This receptor is positively coupled to adenylyl cyclase and displays affinity for antipsychotics such as clozapine. Recently, the effect of 5-HT₆ antagonist and 5-HT₆ antisense oligonucleotides to reduce food intake in rats has been reported (JC Bentley, CA Mardsen, AJ Sleight and KC Fone. Effect of 5-HT₆ antagonist Ro 04-6790 on food consumption in rats trained to a fixed feeding regime. *Br J Pharmacol.* 1999 Suppl. 126, P66; JC Bentley, AJ Sleight, CA Mardsen, KCF Fone.

5-HT₆ antisense oligonucleotide ICV affects rat performance in the water maze and feeding. *J Psychopharmacol Suppl* A64, 1997, 255).

Compounds with enhanced affinity and selectivity for the 5-HT₆ receptor have been identified, e.g. in WO 00/34242 and by M. Isaac, A. Slassi, T. Xin, N. MacLean, J. Wilson, K. McCallum, H. Wang and L. Demchyshyn: 6-Bicyclopiperazinyl-1-arylsulfonylindoles and 6-Bicyclopiperidinyl-1-arylsulfonylindoles derivatives as novel, potent and selective 5-HT₆ receptor antagonists; *Bioorganic & Medicinal Chemistry Letters* 2000, 10, 1719-1721.

DETAILED DESCRIPTION OF THE INVENTION

Certain compounds of formula (I) are capable of existing in stereoisomeric forms
10 including diastereomers and enantiomers and the invention extends to each of these
stereoisomeric forms and to mixtures thereof including racemates. The different
stereoisomeric forms may be separated from each other by conventional methods. Any
given isomer may be obtained by stereospecific or asymmetric synthesis. The invention
also extends to any tautomeric forms and mixtures thereof.

15 The compounds of the formula (I) can form acid addition salts with acids such
as conventional pharmaceutically acceptable acids, for example maleic, hydrochloric,
hydrobromic, phosphoric, acetic, fumaric, salicylic, citric, lactic, mandelic, tartaric and
methanesulfonic.

Compounds of formula (I) may also form solvates such as hydrates and the
20 invention also extends to these forms. When referred to herein, it is understood that the
term "compound of formula (I)" also includes these forms.

The compounds according to formula (I) can conveniently be administered in a
pharmaceutical composition containing the compound in combination with
pharmacologically and pharmaceutically acceptable carriers. Such pharmaceutical
25 compositions can be prepared by methods and contain carriers or excipients which are
well known in the art. A generally recognized compendium of such methods and
ingredients is Remington's Pharmaceutical Sciences by E.W. Martin (Mark Publ. Co.,
15th Ed., 1975). The compounds and compositions can be administered orally,
parenterally (for example, by intravenous, intraperitoneal or intramuscular injection),
30 transdermally, or rectally.

For oral therapeutic administration, the active compound may be combined with
one or more excipients and used in the form of ingestible tablets, buccal tablets, troches,
capsules, elixirs, suspensions, syrups, wafers, and the like. Such compositions and
preparations should contain at least 0.1% of active compound. The percentage of the

compositions and preparations may, of course, be varied and may conveniently be between about 2 to about 60% of the weight of a given unit dosage form. The amount of active compound in such therapeutically useful compositions is such that an effective dosage level will be obtained.

5 The tablets, troches, pills, capsules, and the like may also contain the following: binders such as gum tragacanth, acacia, corn starch or gelatin; excipients such as dicalcium phosphate; a disintegrating agent such as corn starch, potato starch, alginic acid and the like; a lubricant such as magnesium stearate; and a sweetening agent such as sucrose, fructose, lactose or aspartame or a flavoring agent such as peppermint, oil of
10 wintergreen, or cherry flavoring may be added. When the unit dosage form is a capsule, it may contain, in addition to materials of the above type, a liquid carrier, such as a vegetable oil or a polyethylene glycol. Various other materials may be present as coatings or to otherwise modify the physical form of the solid unit dosage form. For instance, tablets, pills, or capsules may be coated with gelatin, wax, shellac or sugar and
15 the like. A syrup or elixir may contain the active compound, sucrose or fructose as a sweetening agent, methyl and propylparabens as preservatives, a dye and flavoring such as cherry or orange flavor. Of course, any material used in preparing any unit dosage form should be pharmaceutically acceptable and substantially non-toxic in the amounts employed. In addition, the active compound may be incorporated into sustained-release
20 preparations and devices.

 The compounds or compositions can also be administered intravenously, or intraperitoneally by infusion or injection. Solutions of the active compound or its salts can be prepared in water, optionally mixed with a nontoxic surfactant. Dispersions can also be prepared in glycerol, liquid polyethylene glycols, triacetin, and mixtures thereof
25 and in oils.

 Useful dosages of the compounds of formula I can be determined by comparing their *in vitro* activity, and *in vivo* activity in animal models. Methods for the extrapolation of effective dosages in mice, and other animals, to humans are known to the art; for example, see U.S. Pat. No. 4,938,949.

30 The compound can be administered in unit dosage form; for example, containing about 0.05 mg to about 500 mg, conveniently about 0.1 mg to about 250 mg, most conveniently, about 1 mg to about 150 mg of active ingredient per unit dosage form. The desired dose may be presented in a single dose or as divided doses administered at appropriate intervals.

The compositions can be administered orally, sublingually, transdermally, or parenterally at dose levels of about 0.01 to about 150 mg/kg, preferably about 0.1 to about 50 mg/kg, and more preferably about 0.1 to about 30 mg/kg of mammal body weight.

The assigned structures were confirmed by standard spectroscopic methods and elemental analysis and/or high resolution MS.

NMR spectra were obtained on Bruker 500 MHz or JEOL 270 MHz spectrometers at 25°C, and the chemical shift values are reported as parts per million (δ). MS spectra were acquired on a 2690 Separation Module (Waters) with a Platform LCZ (Micromass). Flash chromatography was performed on Silica gel 60 (Merck) or

LiChroprep RP-18 (Merck). HPLC analysis were accomplished on a HP Series1100, with a GROM-SIL 100 ODS-0 AB column, 4.6x50mm. The HPLC purifications were performed on preparative HPLC/ Mass system using YMC Combi prep ODS-AQ column, 56x20 mm, Gilson pumps, Dynamax UV-1 detector and Finnigan Mass
5 detector. The used eluents were H₂O and CH₃CN, both with 0.1% TFA. The purity of the compounds was determined by HPLC. Elemental analysis was performed at Structural Chemistry Department, Biovitrum AB, Stockholm. Melting points, when given, were obtained on a Büchi or a Gallenkamp melting point apparatus and are uncorrected.

General Synthetic Methods

Method 1: Buchwald coupling between aryltriflates or arylhalides and amines

To a solution of the aryltriflate (1 equiv.) in xylene are added, under N₂ flush, Pd(OAc)₂ (0.6 equiv.), (R)-2,2'-bis(diphenylphosphino)-1,1'-binaphthyl (BINAP) (0.1 equiv.) and
15 Cs₂CO₃ (3 equiv.), followed by amine (2 equiv.). The mixtures are heated to 100 °C-120 °C under stirring (TLC monitoring). Purification by flash chromatography [SiO₂, CHCl₃ to MeOH:CHCl₃:aq NH₃ (10:90: 0.4%)] afforded the final compounds. The final compounds are converted into their hydrochloride salts by dissolving the free bases in
20 methanol and diethyl ether (1:9) followed by the addition of HCl in diethyl ether.

Method 2: Buchwald coupling between arylhalides and amines

To a mixture of 4-bromoindoles (1 equiv), *t*-Bu₃P (0.05 equiv.) or 2-(dicyclohexylphosphino)biphenyl (0.05 equiv.), and Pd (OAc)₂ (0.02 equiv.) in xylene
25 are added amines (2.8 equiv.) and NaO*t*-Bu (2.8 equiv.). The reactions are heated at 120 °C for 4h, filtered through celite and the solvent is removed. The crude mixtures are purified by column chromatography (SiO₂, CH₂Cl₂/heptane 1:4) to yield final compounds. The final compounds are converted in their hydrochloride salts according to the same procedure as described in Method 1.

30

Method 3: Sulfonylation in the presence of NaOH

Arylsulfonyl chlorides (0.75 mmol) are added to a cold (0°C) solution of indole derivatives (0.5 mmol), grounded NaOH (3 mmol) and tetrabutyl ammonium hydrogen

sulfate (0.05 mmol) in CH₂Cl₂ (3 mL). The mixtures are shaken for 30 min at 0°C and 30 min at room temperature. Each mixture is then filtered through a bed of hydromatrix (Varian; 3 cm) and silica gel (0.5 cm). The system is washed with CH₂Cl₂ (2 x 3 mL) and the solvent is evaporated in vacuum. The resulting residues (final products as free
5 base) are dissolved in CH₂Cl₂ (3 mL) and HCl in ether is added (2 mL) and shaken for 2 h at room temperature. The resulting precipitates are collected by filtration to give the final compounds as hydrochloride salts. The purity of the compounds is analyzed by LC and eventually purified by LC/MS if required.

10 **Method 4: Sulfonylation in the presence of NaH**

Sulfonylchlorides (1.5 equiv.) are added to indoles derivatives (1equiv.) and NaH 60% dispersion in oil (2 equiv.) in CH₂Cl₂ containing DMF (1%). After 1 h at room temperature the reactions are quenched with water, filtered and the solvent is removed. Purification by column chromatography (SiO₂, CH₂Cl₂:MeOH 9:1:0.4 % NH₃) gave the
15 final compounds. The final compounds are transformed into their hydrochloride salts by the procedure described in Method 1.

Method 5: Sulfonylation of sodium salt of 4-(4-*t*-butyloxycarbonyl)-piperazinyl-indole (stock solution A).

20 NaH (163 mg, 6.5 mmol) is added to a solution of 4-(4-*t*-butyloxycarbonyl)-piperazinyl-indole (1.50 g, 6.50 mmol) in THF (45 mL). The reaction is stirred at room temperature for 0.5 h. The suspension is diluted to 60 mL with THF and distributed into 30 reaction vials (stock solution A). Diverse sulfonylchlorides (0.25 mmol) in THF (2 mL) are added to the stock solution A (2 mL). The reactions are shaken for 3 h followed by
25 addition of MeOH (100 µL). Polystyrene-trisamine (PS-trisamine) is added to the mixtures and the reactions are agitated at room temperature over night. The mixtures are filtered through a short silica column and the volatiles are removed. The crude products are dissolved in MeOH (2 mL) followed by addition of HCl/ether 2 M (4 mL). After 0.5 h the sample was centrifugated and the supernatant was decanted after 0.5 hrs. The
30 remaining solid was washed with (ether) and dried *in vacuo* to afford the hydrochloride salts.

5 **5-Bromo-1-triisopropylsilyl-indole**

5-Bromoindole (3.92 g; 20 mmol) was dissolved in DCM (100 mL) and DMF (1 mL). NaH (0.88 g, 22 mmol; 60% in oil) was added to the cooled solution. After stirring for 15 minutes, triisopropylsilyl chloride (3.86 g, 20 mmol) was added dropwise to the reaction mixture. After 3 h, water (1 mL) was added, followed by MgSO₄. The mixture was filtered and concentrated and the residue put through a silica column with hexane as eluent. The product was obtained as a pale yellow oil (5.96 g, 17 mmol; yield 85 %). ¹H NMR (CDCl₃) δ 1.13 (18 H, d, J=8), 1.67 (3 H, m), 6.55 (1 H, d, J=3), 7.21 (1 H, dd, J=9, 2), 7.24 (1 H, d, J=3), 7.36 (1 H, d, J=9) and 7.74 (1 H, d, J=2).

Pharmacological tests

- The ability of a compound of the invention to bind the 5HT₆ receptor can be determined using *in vivo* and *in vitro* assays known in the art. The biological activity of
15 compounds prepared in the Examples was tested using different tests.

5-HT₆ Intrinsic Activity Assay

- Antagonists at the 5HT₆ receptor were characterized by measuring inhibition of 5-HT induced increase in cAMP in HEK 293 cells expressing the human 5-HT₆ receptor (see Boess et al. (1997) Neuropharmacology 36: 713-720). Briefly, HEK293/5-HT₆
20 cells were seeded in polylysine coated 96-well plates at a density of 25 000 / well and grown in DMEM (Dubecco's Modified Eagle Medium) (without phenol-red) containing 5% dialyzed Foetal Bovine Serum for 48 hours at 37°C in a 5% CO₂ incubator. The medium was then aspirated and replaced by 0.1 ml assay medium (Hanks Balance Salt Solution containing 20 mM HEPES, 1.5 mM isobutylmethylxanthine and 1 mg/ml
25 bovine serum albumin). After addition of test substances, 50 µl dissolved in assay medium, the cells were incubated for 10 min at 37°C in a 5% CO₂ incubator. The medium was again aspirated and the cAMP content was determined using a radioactive cAMP kit (Amersham Pharmacia Biotech, BIOTRAK RPA559). The potency of antagonists was quantified by determining the concentration that caused 50% inhibition

of 5-HT (at $[5\text{-HT}] = 8 \text{ times } EC_{50}$) evoked increase in cAMP, using the formula $K_i = IC_{50} / (1 + [5HT] / EC_{50})$. Typically, the 5-HT₆ receptor affinity values (K_i) were in the range of from 0.1 nM to 2 μ M.

5 **Method for in vivo assay of reduction of food intake**

Animals

Obese (ob/ob) mouse is selected as the primary animal model for screening as this mutant mouse consumes high amounts of food resulting in a high signal to noise ratio. To further substantiate and compare efficacy data, the effect of the compounds on food consumption is also studied in wild type (C57BL/6J) mice. The amount of food consumed during 15 hours of infusion of compounds is recorded.

Male mice (obese C57BL/6JBom-Lep^{ob} and lean wild-type C57B1/6JBom; Bomholtsgaard, Denmark) 8-9 weeks with an average body weight of 50 g (obese) and 25 g (lean) are used in all the studies. The animals are housed singly in cages at $23 \pm 1^\circ\text{C}$, 40-60 % humidity and have free access to water and standard laboratory chow. The 12/12-h light/dark cycle is set to lights off at 5 p.m. The animals are conditioned for at least one week before start of study.

Compounds

The test compounds are dissolved in solvents suitable for each specific compound such as cyclodextrin, cyclodextrin/methane sulfonic acid, polyethylene glycol/methane sulfonic acid, saline. Fresh solutions are made for each study. Doses of 30, 50 and 100 mg kg⁻¹ day⁻¹ are used. The purity of the test compounds is of analytical grade.

Minipump implantation

The animals are weighed at the start of the study and randomized based on body weight. Alzet osmotic minipumps (Model 2001D; infusion rate 8 μ l/h) are used and loaded essentially as recommended by the Alzet technical information manual (Alza Scientific Products, 1997; Teeuwes and Yam, 1976). Continuous subcutaneous infusion with 24 hours duration is used. The minipumps are either filled with different concentrations of test compounds dissolved in vehicle or with only vehicle solution and maintained in vehicle pre-warmed to 37°C (approx. 1h). The minipumps are implanted subcutaneously in the neck/back region under short acting anesthesia (metofane/enflurane). This surgical procedure lasts approximately 5 min. It takes about 3 h to reach steady state delivery of the compound.

Food intake measurements

The weight of the food pellets are measured at 5 p.m. and at 8 p. m. for two days before (baseline) and one day after the implantation of the osmotic minipumps. The weigh-in is performed with a computer assisted Mettler Toledo PR 5002 balance.

- 5 Occasional spillage is corrected for. At the end of the study the animals are killed by neck dislocation and trunk blood sampled for later analysis of plasma drug concentrations.

Determination of plasma concentration

- 10 The plasma sample proteins are precipitated with methanol, centrifuged and the supernatant is transferred to HPLC vials and injected into the liquid chromatography /mass spectrometric system. The mass spectrometer is set for electrospray positive ion mode and Multiple Reaction Monitoring is used.

A linear regression analysis of the standards forced through the origin is used to calculate the concentrations of the unknown samples.

15 **Statistical evaluation**

- Food consumption for 15 hours is measured for the three consecutive days and the percentage of basal level values is derived for each animal from the day before and after treatment. The values are expressed as mean \pm SD and \pm SEM from eight animals per dose group. Statistical evaluation is performed by Kruskal-Wallis one-way ANOVA
- 20 using the per cent basal values. If statistical significance is reached at the level of $p < 0.05$, Mann-Whitney U-test for statistical comparison between control and treatment groups is performed.

Intc. application No.
PC-T/SE01/02319

Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☐ Claims Nos.:
because they relate to subject matter not required to be searched by this Authority, namely:

2. ☒ Claims Nos.: 1
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:

see next sheet

3. ☐ Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:

4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
☐ No protest accompanied the payment of additional search fees.

INTERNATIONAL SEARCH REPORT

Inter .pplication No.
PCT/SE01/02319

The search revealed a large number of substances relevant to the issue of novelty. So many documents were retrieved that it is impossible to cover all the previously known substances in the report. Therefore the number of substances represented in this report has been restricted and a representative selection of documents has been cited.
